Stop toggling. Start knowing.

Intelligence that lives where work happens, not where data is stored.

Revenue leaders don't need more dashboards. You need answers to the questions that keep you up at night. Most AI tools reason from partial, manually-logged CRM data - confident responses built on an incomplete story. Critical decisions get made on what reps remembered to log, not what actually happened.

Backstory captures every email, meeting, call, and chat automatically. Model Context Protocol (MCP) delivers that complete intelligence directly into the tools your team already uses - Claude, Copilot, or ChatGPT - so you get answers grounded in reality, not guesswork.

Stay in the flow

Ask revenue questions where you already work. No new systems to learn. No jumping between dashboards to make a decision.

Trust the reality

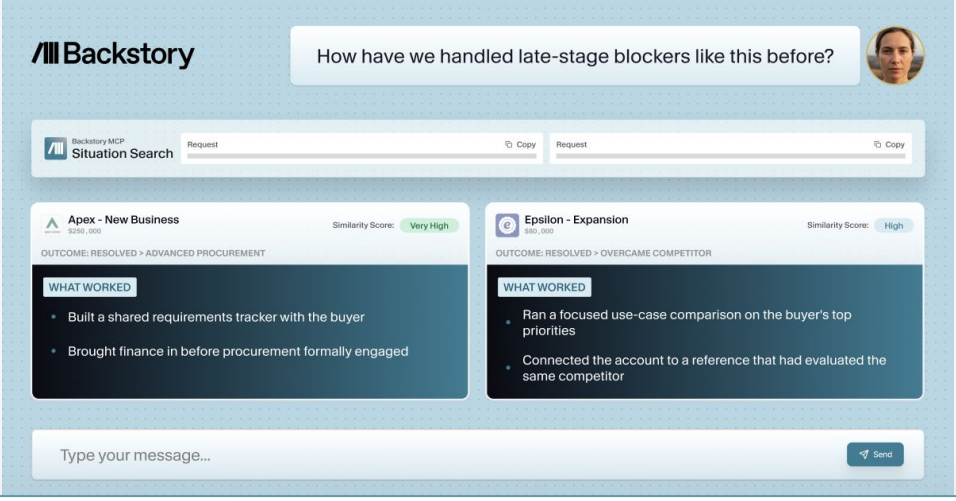

Every answer is grounded in complete activity data - not CRM fields. See the full history of every deal, every interaction, every stakeholder.

Act with confidence

Know what to do next. Clarify deal risk, identify real buying power, and focus your team on the deals worth winning.

Learn from what worked

Your organization has solved this before. Situation Search finds the most comparable deals from your history - and what it took to move them forward.

Andrew Brown

"Backstory's open architecture fits perfectly with our vision to become an AI enabled enterprise. Our sales team now has the intelligence they need to make informed decisions. This resulted in win rates that improved by over 50 percent."

Senior Vice President and Chief Revenue Officer
